- 1. Seguir los pasos del laboratorio de firebase.
- 2. Creamos los layouts:

Código xml:

```
<TextView
       android:layout height="wrap content"
       app:srcCompat="@drawable/login" />
   <EditText
       android:inputType="text"
   <EditText
       android:layout height="71dp"
       android:inputType="text"
       app:layout constraintBottom toTopOf="@+id/btningresar"
       app:layout constraintEnd toEndOf="parent"
       app:layout constraintVertical bias="0.946" />
```

Código xml:

```
<TextView
   app:layout constraintVertical bias="0.648" />
<EditText
   android:layout width="320dp"
   android:layout height="68dp"
   android:layout marginBottom="32dp"
   android:inputType="text"
    app:layout constraintBottom toTopOf="@+id/edtregnombre"
    app:layout constraintEnd toEndOf="parent"
<EditText
   app:layout constraintVertical bias="0.81" />
<EditText
```

Una vez configurado el firebase y agreagados los layouts, trabajaremos en el (LOGIN):

```
startActivity(Intent(this, RegisterActivity::class.java)) //
redirección al fragment registro
}
     }
    }
btnregistro.setOnClickListener{
    startActivity(Intent(this, RegisterActivity::class.java)) //
redirección al fragment registro
}
```

Luego de configurar el main activity (Login): En FIREBASE --- Compilación authentication:

Escoger Correo electrónico y contraseña

Guardamos

Agregamos un usuario

Luego para el registro:

Necesitamos una carpeta model con un kotlin class file Usuarios model

```
AndroidManifest.xml

Igaya

Com.algarrobo.pc2_2021_2_mg

Models

GusuariosModel

LoginActivity

MainActivity

RegisterActivity

com.algarrobo.pc2_2021_2_mg (androidTest)

com.algarrobo.pc2_2021_2_mg (test)
```

Codigo UsuariosModel:

```
package com.algarrobo.pc2_2021_2_mg.models

data class UsuariosModel (
    val DNI: String="",
    val NombreCompleto: String="",
    val Clave: String =""
)
```

Luego en Register activity:

```
val edtregdni: EditText = findViewById(R.id.edtregdni)
val edtregnombre: EditText = findViewById(R.id.edtregnombre)
```

```
val edtregpassword: EditText = findViewById(R.id.edtregpassword)
val edtreqpassword2: EditText = findViewById(R.id.edtreqpassword2)
    var DNI = edtregdni.text.toString()
    var Clave = edtregpassword.text.toString()
    var claveverif = edtregpassword2.text.toString()
                val user: FirebaseUser? = auth.currentUser
UsuariosModel(DNI,Clave,NombreCompleto)
                collectionRef.add(usermodel)
                    .addOnCompleteListener{
                    }.addOnFailureListener{error->
                    ).show()
                startActivity(Intent(this, LoginActivity::class.java))
                        findViewById(android.R.id.content)
                    ).show()
```
